**THE NEW TREND-SETTING AND PATENTED BUSINESS CONCEPT.
FOR SPOT REPAIR JOBS**

**WE ACCOMPANY YOU IN THE FUTURE
INVEST TO SAVE COST**

We do not only offer the complete hardware solution, but we also accompany you in the future. Since decades, the company s.tec GERMANY offers intelligent and innovative solutions in the field of punctual extraction. The company has established itself as a leader supplier in Germany and foreign countries as well.

New markets require innovative, intelligent and cost-effective technologies. For the professional entrance in the growing market of spot repair, s.tec GERMANY has developed the spot repair system “MultiSpeedMaster”.

- Thanks to the anti-static transparent curtain system at the MultiSpeedMaster working bay, a clean separation is achieved from the rest of the workshop. The MultiSpeedMaster working bay is equipped with all necessary equipment in a modular design.
- The entire vehicle preparation including the painting and drying process takes place at the “MultiSpeedMaster” working bay.
- The “MultiSpeedMaster” working bay in the size of 7 x 5 m can be integrated into any normal workshop.
- Easy installation of “MultiSpeedMaster” working bay, similar to a car lift installation. The basic framework is the self-supporting inserted ceiling with 4 stand supports for taking up all needed equipment.

Useful options are:

- High vacuum extraction rails along the working bay allow the punctual extraction of swarf. The power supply for the needed additional tools is delivered by the energy box included.
- Mobile furniture, cleaning equipment, wheel jack, car lifts and other equipment available.

- The system doesn't need authorization due to its small pollutant quantities and due to the fact of its installation place: “intermittent enterprise”.
- Smooth running inlet and outlet hoods with filter cartridge for accurate positioning at the spotting area. This assures a quick and clean paint-job.
- Low inlet and outlet air volume, with no need of heating normally, guarantees a minimal energy and consequential charges.
- The inlet hood uses the loss warmth from the workshop for an optimal painting temperature in the MultiSpeedMaster working bay.
- Perfect illumination of the working bay by ATEX high power lighting.
- The paint drying process is accomplished using infrared dryer.
- A two-day training of the spot repair at our “MultiSpeedMaster” working bay in our academy is a part of the delivery.

Packages for “MultiSpeedMaster”:

- “Starter” for a working bay of 7 x 5 m, with a U-shape bay separation, a toxic extraction hood, movable in a ceiling rail, containing filter element and also a movable lengthwise inlet hood. Integrated high-power lamps provide a perfect lighting of the working bay.
- “Starter plus” here in addition to Starter, a portable infrared dryer on a pedestal is included.
- “Standard” here in addition to Starter package, a second toxic extraction hood, movable in a ceiling rail, containing filter element on the opposite lengthwise side of the working bay is included.
- “Standard plus” here in addition to Standard, a portable infrared dryer on a pedestal is included.
- “Premium” our top version similar to Standard Plus with additional two power rails each with power supply energy box, containing compressed air and extraction plugs, and a central vacuum unit included
- “Premium plus” here in addition to Premium, a boosted infrared dryer, adjustable and movable around the working bay included.
